

The HoRNet TrackShaper is a “mix on autopilot” utility for those who want to have good sounding tracks without spending hours tweaking plugins.

The TrackShaper is based on the HoRNet ChannelStrip MK2 technology and includes several specific algorithm for different sound sources like: kick drum, snare, acoustic instruments, guitars, etc.

Each algorithm acts on many different EQ and compression parameter that you can tweak using a single knob called “effect amount” that dynamically changes the EQ and compression characteristic of the algorithm.

Due to the fact that each algorithm reacts dynamically to the input signal you have to carefully set the input and output level, the TrackShaper

provides input and output gain knobs and level indicator: a green dot lights up when the signals are in the correct range.

For those who want quick result, the TrackShaper also provide an “auto gain” adjust feature, that automatically sets the correct input and output gain based on the level of the signal.

OUTPUT LEVEL METER: THE ORANGE ARROWS TELL YOU ON WHICH SIDE TO TURN THE OUTPUT KNOB, A GREEN DOT LIGHTS UP WHEN THE SIGNAL PEAKS AT +0VU

OUTPUT GAIN: THIS KNOB ADJUSTS THE OUTPUT LEVEL

TRACK TYPE SELECTION, FROM THIS DROPDOWN YOU CAN CHOOSE THE DIFFERENT MIXING ALGORITHM

OUTPUT LEVEL METER: THE ORANGE ARROWS TELL YOU ON WHICH SIDE TO TURN THE OUTPUT KNOB, A GREEN DOT LIGHTS UP WHEN THE SIGNAL PEAKS AT +0VU

OUTPUT GAIN: THIS KNOB ADJUSTS THE OUTPUT LEVEL

EFFECT AMOUNT: TWEAKING THIS KNOB CHANGES THE INTERNAL ALGORITHM PARAMETER APPLYING MORE OR LESS EQ AND COMPRESSION

INPUT AND OUTPUT AUTO GAIN: ENABLE ANY OF THESE SWITCHES TO LET THE PLUGIN DETERMINE THE OPTIMAL INPUT AND OUTPUT GAIN
